

A three piece kayak can get you to places that you can only dream off

3pc Carbon Kevlar kayaks

Now fully tested in expedition environments and we are totally happy with this construction.

Stiffer and stronger than a 1pc

Our 3pc kayaks have evolved over the years. In the early days the bulkheads were bolted together. This method was not strong enough so after testing in Antarctica we developed the current clamping system. Tom Burgh from main Island in the US is seen standing inspecting our kayaks before flying into King George Island. Freya Hoffmeister also used one of the early 3pc kayaks to circumnavigate Iceland.

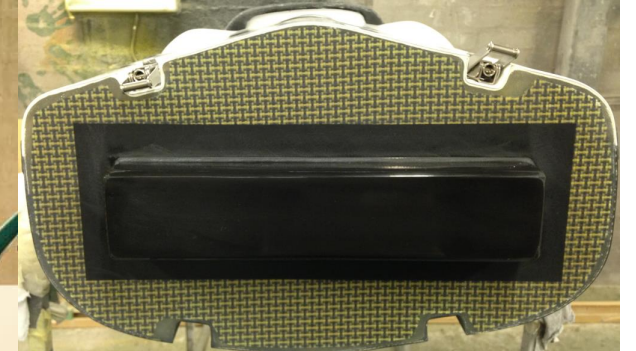

The current 3pc kayaks have successfully completed many more expeditions around the world.

JOINING A 3pc KAYAK ONLY TAKES TWO TO THREE MINUTES

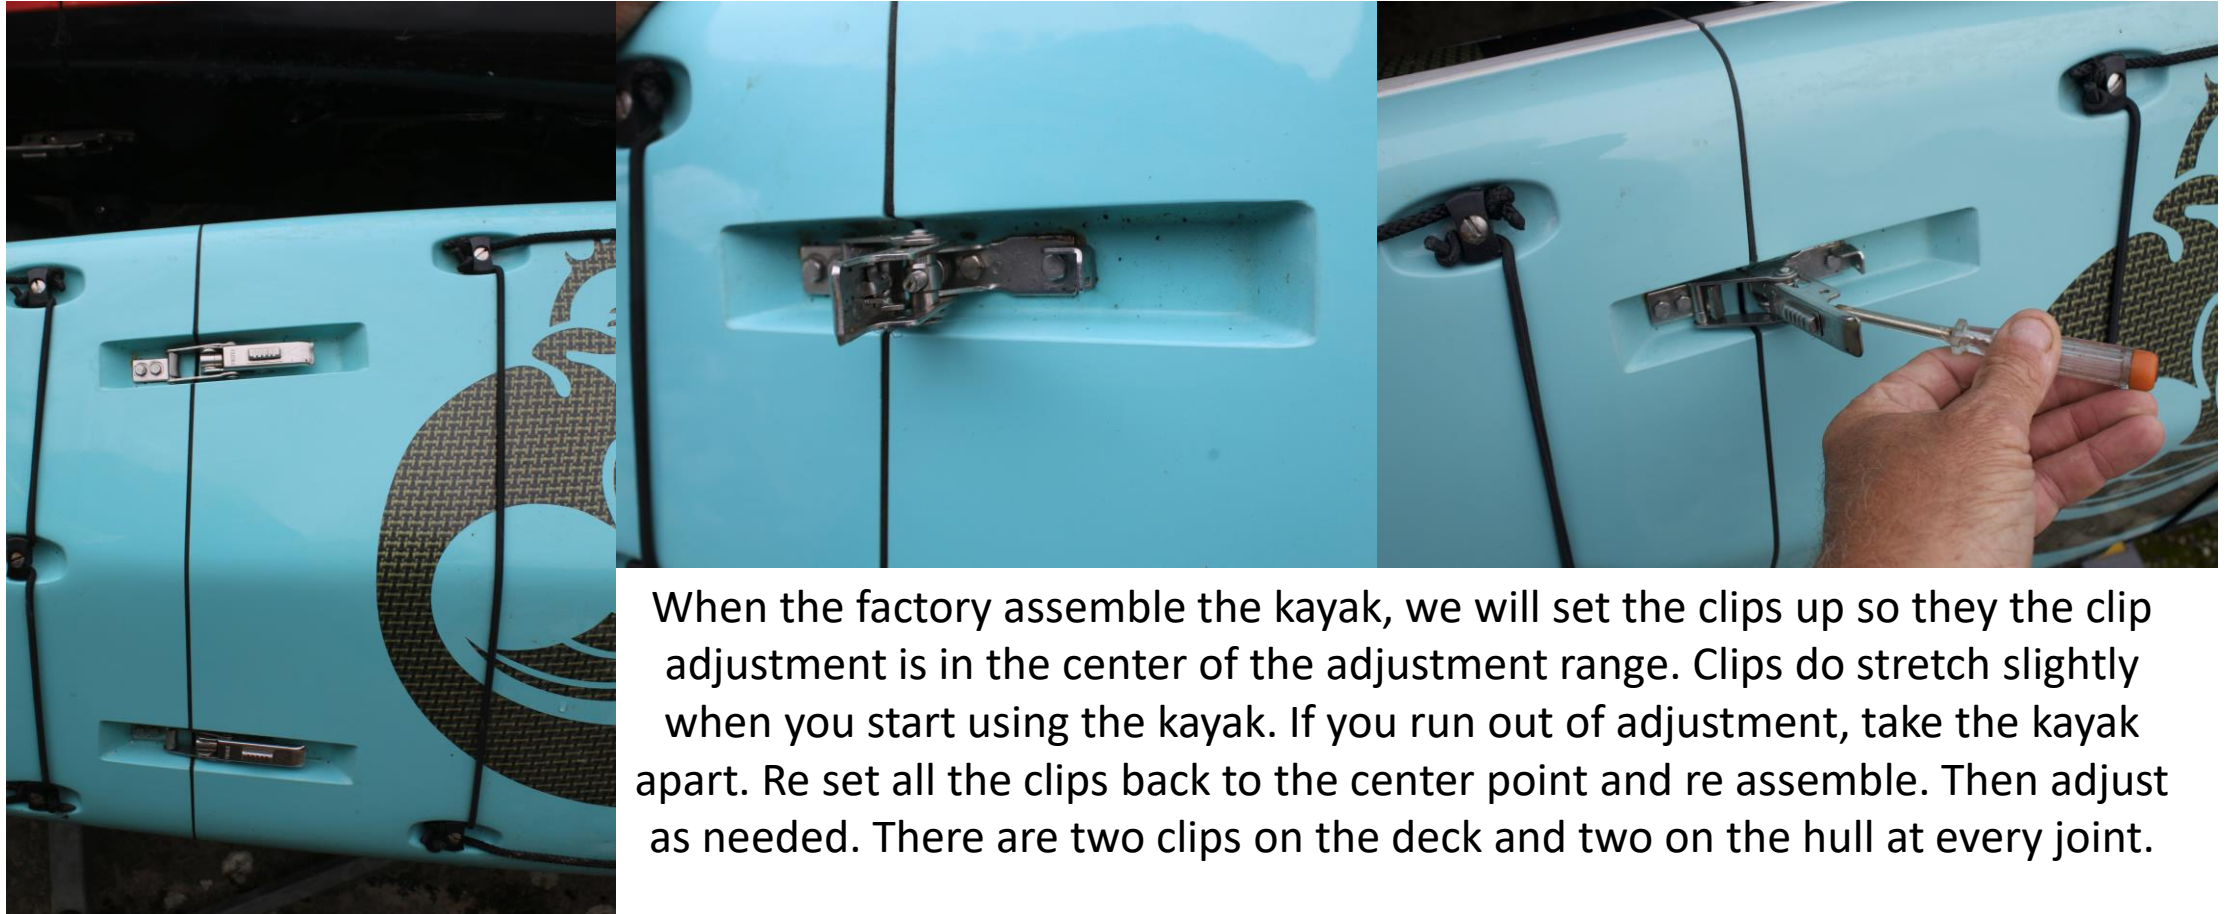

A sectional 3pc kayak is a must for travel and expeditioning, storage and even security when kept in the car.

Rope or wire skieg, full adjustment, quick and easy to assemble

Kayak joint adjustment

When the factory assemble the kayak, we will set the clips up so they the clip adjustment is in the center of the adjustment range. Clips do stretch slightly when you start using the kayak. If you run out of adjustment, take the kayak apart. Re set all the clips back to the center point and re assemble. Then adjust as needed. There are two clips on the deck and two on the hull at every joint.
